decision at t_0: only past measurements, H, L, Δf
observation window, at most T^s_{min}
outcome known at $t_0 + T^s_{min}$ (or when the user leaves j): dwell time, ΔQ, failure
ΔQ: mean gap over the window
Q_{out}
source cell c (serving before t_0)
source cell c after t_0: counterfactual, measured as a neighbour
target cell j (serving after t_0)
